

Creating merged column horizontally

On this page

- [\\$tableprop.mergeColumns\(int number\)](#)
- [\\$tableprop.mergeColumns\(String stringNumber\)](#)

There are two methods that you can use to set column to merged column.

\$tableprop.mergeColumns(int number)

When you put the statement in to a column, it will be set as merged column in a specified number.

For example:

Template Code:

Project	<code>\$tableprop.mergeColumns(\$Package.size())Packages</code>
	<code>#forcol(\$p in \$Package)\$p.name#endcol</code>

Output:

Project	Packages		
	Package A	Package C	Package B

\$tableprop.mergeColumns(String stringNumber)

When you put the statement in to a column, it will be set as merged column in a specified string of number.

For example:

Template Code:

Project	<code>\$tableprop.mergeColumns("3")Packages</code>
	<code>#forcol(\$p in \$Package)\$p.name#endcol</code>

Output:

Project	Packages		
	Package A	Package C	Package B

See [Creating Merged Column Horizontally for DOCX](#).

Note
