

Teamwork Cloud projects

A **Teamwork Cloud project** creates Data Sources on the repository server and can be identified as the same project for different clients. Since the DHLink mapping detail is stored along with the project details on the Teamwork Cloud, all clients can see and receive changes from one another, in case they update the changes before committing.

The project is treated in compliance with the Teamwork Cloud rules. For instance, you need to log on to Teamwork Cloud first before checking out the items that you need to work on. For more information about Teamwork Cloud, see [Collaborative modeling](#) in the MagicDraw® User Guide.
