

Alf Tutorial 2: Address Book

This tutorial describes how to create an Alf project containing a simple *Address Book* model, along with a test Activity that can be executed using Magic Model Analyst. (This model is similar to, but even simpler than, the one in the [Address Book](#) sample model.)

It consists of the following steps:

- [Creating the Address Book class diagram](#)
- [Creating Entry attributes](#)
- [Creating an Entry constructor](#)
- [Creating AddressBook operations](#)
- [Testing the AddressBook](#)
