

Searching

Searching the modeling tool is designed to search within model elements, as well as element properties. You can also perform a quick search without defining any advanced options, or you can replace any text quickly using the **Find and Replace** type of search.

You can read more about types of search dialogs in the related pages.

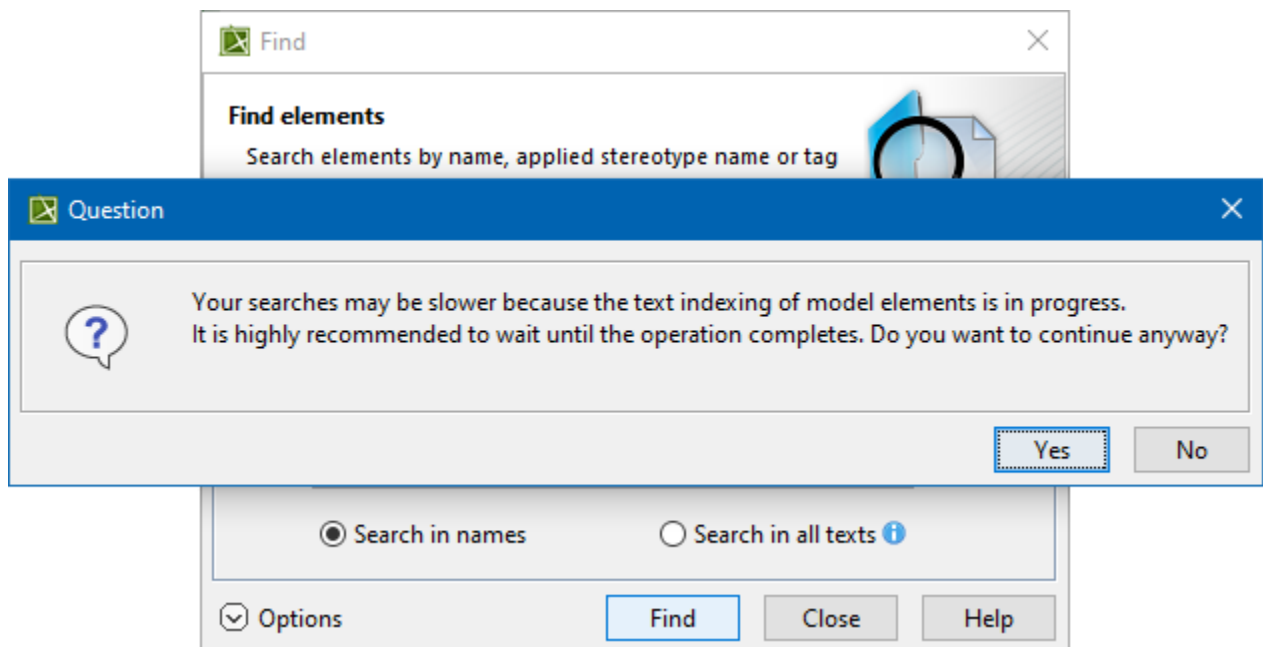

The search is performed as a background task; while searching, you may still read the model and browse it. If you make changes in the model, the search stops and presents incomplete search results in the **Search Results** tab of the **Model Browser**. You need to restart the search to get the full list of results.

If there is a large number of search results to display (more than 1000), the following message appears:

Click **Yes** to continue searching, or click **No** to stop searching and correct the query.

If the indexing of model elements is in progress, the following **Question** dialog appears before performing a search in the **Find** and **Find and Replace** dialogs:

Click **Yes** to perform a search while indexing is still in progress, or click **No** to stop searching and wait for the indexing operation to complete in order to prevent slow searching.
