

# Disabling authentication with username and password

You can disable authentication with a username and password as described below.

This feature affects only the logins using the Authentication server, such as logging into Teamwork Cloud from web applications and from a modeling tool using SSO.

To disable authentication with a username and password

---

1. Go to the `install_root\AuthServer\config` directory and open the `authserver.properties` file.
2. In the file, find the `disable.credentials.authentication` property and change its value to `true`.
3. Restart Teamwork Cloud services.
