- Validating a project with active validation suites
- Selecting active validation mode
- Specifying the active validation period
- Customizing active validation options
- Turning off the parameters synchronization

Introduction

Active validation suites enable you to immediately see if a model is correct and complete, instantly displaying any errors in the model and suggesting appropriate solutions. The active validation suites have the «activeValidationSuite» stereotype applied.

Each profile contains its own active validation suites. You can create your own validation suites.

You can see the following active validation suites in the Validation dialog or Validation Suites dialog:

- Numbering Validation contains constraints that check if the element number is unique.
- Parameters Synchronization contains constraints that keep your model valid and synchronized with your changes. You can turn off parameters
- Path Overlapping contains constraints that check to ensure that paths do not overlap.
- Pins Displaying contains constraints that check to ensure that actions do not contain hidden Pins.
- Relations Ownership contains constraints that check if a relationship has the same owner as its end elements.
- Shape Ownership contains constraints that check the element and path owner: if the symbol owner on the diagram correctly reflects the element owner in the model and the element, and If the diagram on which the symbol is drawn belongs to the same owner.
- Text References Validation (Auto) contains constraints that check if the hyperlink text and the referenced element are coherent.
- UML Correctness contains constraints that check the Ports compatibility, Pin types compatibility, Slot and Tags multiplicity correctness, etc.
- Diagram Merge contains constraints that check if the diagrams or symbols are merged correctly.

can find active validation suites in the Containment tree when the Show Auxiliary Resources option is enabled. Expand the UML Standard Profile

Package > Validation Profile Package > Active Validation package

To show the auxiliary resources

Validating a project with active validation suites

To manually validate a project with active ation suite, you can select the specific validation suite (mentioned above) as the **Validation Suite** in the **Validation of alloute** Model Browser, click and enable the **Show Auxiliary Resources** option. idation dialbythe Model Browser, click

How to start the validation >>

Selecting active validation mode

Active validation automatically runs in the background according to the selected active validation mode.

To select the active validation mode

- 1. Do one of the following:
 - On the main menu, select Analyze > Validation > Active Validation.
 - On the main menu, select Options > Environment. On the left of the Environment Options dialog, select Active Validation group. Select the Active Validation option.
- 2. Select one of the following modes:
 - All enables all (user defined and system) active validation suites.
 - System enables validation suites that are critical to the model. For example, all projects have the UML Standard Profile, which has the Composition Integrity system validation suite. This suite contains validation rules allowing for detecting shared project usage, recovered element, or illegal reference related problems.

Info

Selected validation suites are active for all projects, not just the current project.

Specifying the active Walidation period Auxiliary Resources > UML Standard Profile > Validation Profile > Composition Integrity.

You can control how often, in seconds, a modeling tool will analyze the rules to be executed and how often the modeling tool will execute these rules. After opening a project, all required validation will swiff be executed, including system or all (user and system), and next time these rules will be checked only after the specified period.

To specify the active validation period

o In the Model Browser, click and enable the Show Auxiliary Resources option.

- 1. On the main menu, select Options > Environment.
- 2. On the left of the Environment Options dialog, select Active Validation group.
- 3. Select the Active Validation Period (seconds) option.
- 4. Type its value in seconds.

Cify a higher time period to ensure better performance of the application.

5. Click OK.

The specified period is used for all projects, not just the current project.

Customizing active validation options

You can customize the Active Validation options in the Project Options dialog.

To open the Active Validation options

- 1. Open the Project Options dialog in one of the following ways:
 - On the main menu, select **Analyze** > **Validation** > **Active Validation Options**.
 - On the main menu, select Options > Project. In the Project Options dialog, select General > Validation.
- 2. Specify the options you need in the Active Validation area. How to use the Project Options dialog >>
- 3. Click OK.

Optimizing performance

- Set the Validate Only Visible Diagrams option value to true. This limits a validation scope to visible diagrams only.
- Set the Exclude Elements from Used Read-Only Project option value to true to reduce the number of elements to check in your model.
- Set the Exclude elements from additional content option value to true to ignore the content of Smart packages while running the passive

Turning off the parameters as upchronization alidate) dialog.

- To turn off the parameters synchronization
 Smart package content (separate elements) will be validated only if Smart package is set directly as a scope of the active validation.
 - 1. Only the mark and is selection in the active validation scope, modeling tool will automatically exclude it from the active validation scope, because

 - In the Registry Options dialog select Generally Green and Select Synchronize Parameters and Arguments option and set its value to false.
