

Specifying representation attributes

Each Data Marking inherits representation attributes from the Data Marking Data Type element located in the Data Markings Profile. There are four representation attributes in total:

- [bannerMarking](#)
- [portionMarking](#)
- [color](#)
- [incompatible](#)

The representation attributes are represented as [slots](#) whose values can be specified for each Data Marking individually. Once the slots are specified, they are displayed in:

- the Data Marking Category's Specification window > **Data Markings** property group > **Slots** column.
- the Data Marking element's Specification window > **Specifics** property.
- the Data Marking element's Specification window > **Slots** property group.
