Checking a visited State

The *WasInState* function checks whether the state with the given name has ever been visited for a particular object:

```
WasInState(in object: any[1], in stateName: String): Boolean
```

Both arguments of the function are required. For example"

```
if (WasInState(obj, "S1") {
        WriteLine("Obj was in state S1.");
}
```
